

Meeting minutes made by Teagan Reddy (SU no. 26012243)

Date: 10/06/2026

Agenda:

- Concept Design Review
- Detail Design Review
- Procurement Process
- July recess work plan

Summary:

- The process for ordering components and 3D printing is all on STEMLearn. Will need to get a motivation for every component signed before submitting an order.
- The linear rail concept is preferred. Automating the linear system will require an extra motor and control system.
- Create a spreadsheet for all the components that will be purchased, also add alternatives in case components are not available.
- Regarding the electronic design, a Pugh matrix will be used to evaluate if the battery design is viable due to the reduced operating time.
- The BLDC motor is preferable due to the larger rotor design. Need to provide motor calculations in the motivation.
- I will be able to use components from the Mechatronics lab; however, they will have to be returned in early October.
- Need to have completed detail design by next meeting.
